

# Module 4: Vectors

## Learning Objectives

1. Write code to call member functions given member function declarations.
2. Write code that creates and uses vectors.

## Process Skills

1. Information processing. Extract structural patterns from sample code.
2. Critical thinking. Interpret member function declarations.

Please fill in the roles for each member of your team. Take a look at the description of each role to see its responsibilities. If there are only three people in the group, please assign the same person to the **Presenter** and **Reflector** role. It is a good idea to select roles that you have not recently taken.

Team name: \_\_\_\_\_

Date: \_\_\_\_\_

Role	Team Member Name
<b>Manager.</b> Keeps track of time and makes sure everyone contributes appropriately.	
<b>Presenter.</b> Talks to the facilitator and other teams.	
<b>Reflector.</b> Considers how the team could work and learn more effectively.	
<b>Recorder.</b> Records all answers and questions and makes the necessary submission.	

For virtual activities: Once you select your roles, [change your Zoom name](#) using the format and example below.

*Format: Group X: First name, Last name initial / Role*

*Example: Group 1: Paul I / Presenter*

Model 1. `std::vector` (6 min)

Start time: \_\_\_\_\_

The class diagram below shows a simplified version of the `std::vector` class that highlights common methods. You can find the full vector class at

<https://en.cppreference.com/w/cpp/container/vector>.

<p><b><code>std::vector</code></b></p> <hr/> <p>// member variables not // shown here</p> <hr/> <pre>vector(); vector(size_type count); vector(const std::vector&amp; other); vector(std::initializer_list&lt;T&gt; init); reference at(size_type pos); void push_back(const T&amp; value); void clear(); size_type size() const; bool empty() const;</pre> <p>// other member functions not // shown here</p>	<p><i><code>std::vector</code> is a template class, where we provide the contained elements' data type during construction. We use <i>T</i> to refer to the template data type.</i></p> <p><i><code>size_type</code> is a data type used in <code>std::vector</code> that can hold positive non-fractional numbers</i></p> <p><b>Member functions</b></p> <p><b><code>vector()</code></b>; - constructs an empty container.</p> <p><b><code>vector(const std::vector&amp; other)</code></b>; - constructs a container and copies the contents of <code>other</code>; also called the <i>copy constructor</i></p> <p><b><code>vector(size_type count)</code></b>; - constructs container with <code>count</code> instances using default values for the elements.</p> <p><b><code>vector(std::initializer_list&lt;T&gt; init)</code></b>; - constructs a container with the contents of the initializer list <code>init</code></p> <p><b><code>reference at(size_type pos)</code></b>; - returns a reference to the element at specified location <code>pos</code>, with bounds checking. <code>reference</code> gives access to the element stored in the vector.</p> <p><b><code>void push_back(const T&amp; value)</code></b>; - appends the given element value at the end of the container. <code>T</code> refers to the vector's template data type so it expects value to have the same data type.</p> <p><b><code>void clear()</code></b>; - erases all elements from the container. After this call, <code>size()</code> returns zero.</p> <p><b><code>size_type size()</code></b>; - returns the number of elements in the container.</p> <p><b><code>bool empty() const</code></b>; - checks if the container has no elements.</p>
--	--

1. How many constructors are shown in the `std::vector` class diagram?

4

2. Which member function appends values at the end of the `std::vector` container? Write the name of the function below.

push\_back

3. Which member function can tell us if the `std::vector` container does not contain any values? Write the name of the function below.

empty

## Model 2. Using `std::vector` (15 min)

Start time: \_\_\_\_\_

Line	Code	Visualization
01	<code>std::vector&lt;double&gt; donations;</code>	<div>donations: std::vector</div>
02	<code>donations.push_back(100.0);</code>	<div>donations: std::vector</div> <div>100.0</div> <div>0</div>
03	<code>donations.push_back(224.25);</code>	<div>donations: std::vector</div> <div>100.0 224.25</div> <div>0 1</div>

04	<pre>donations.at(0) = 125.50;</pre>	<table><tr><td colspan="2">donations: std::vector</td></tr><tr><td>125.50</td><td>224.25</td></tr><tr><td>0</td><td>1</td></tr></table>	donations: std::vector		125.50	224.25	0	1
donations: std::vector								
125.50	224.25							
0	1							
05	<pre>std::cout &lt;&lt; donations.at(1);</pre>	Screen output: 224.25						
06 07 08	<pre>std::size_t donation_count =     donations.size(); std::cout &lt;&lt; donation_count     &lt;&lt; "\n";</pre>	Screen output: 2						
09	<pre>donations.clear();</pre>	<table><tr><td>donations: std::vector</td></tr><tr><td></td></tr></table>	donations: std::vector					
donations: std::vector								
10 11 12 13 14 15 16	<pre>bool is_empty = donations.empty(); if (is_empty) {     std::cout &lt;&lt; "No donations.\n"; } else {     std::cout &lt;&lt; "Received "         &lt;&lt; "donations.\n"; }</pre>	Screen output: No donations						

4. Which `std::vector` constructor did we use in line 01? Write the constructor's function declaration below.

The default constructor  
`vector();`

5. Complete the table below to indicate the number of elements in the `std::vector` container after performing code in the specified line numbers

Line	Number of elements in donations
01	0
02	1
03	2
04	2

6. Where in the `std::vector` container does the `push_back` member function add an element? Place a check (✓) beside your answer.

- a. Front of the container
- b. Middle of the container
- c. End of the container ✓

7. Line 04 passes 0 as the argument to the `at` member function. Which element in the container does it change? We use the term *position* or *index* to refer to an element's location in the container. *position* or *index* starts at 0. Place a check (✓) beside your answer.

- a. First element ✓
- b. Second element
- c. None of the elements

8. The `at` member function can access values inside a `std::vector` container. Complete the table below to specify the argument you would pass to the `at` member function to access the corresponding element in a `std::vector` container. Assume we have a `std::vector` that contains 100 elements.

<code>std::vector</code> container element	argument passed to the <code>at</code> member function
First element	0
30th element	29
Last element	99

9. What does the size member function return? Place a check (✓) beside your answer.

- a. The number of elements in the `std::vector` container. ✓
- b. The position of the last element in the `std::vector` container.
- c. The position of the first element in the `std::vector` container.

10. When using a `std::vector`, what values do we expect to get from the size and empty member functions after calling the clear member function? Complete the table below with the expected values.

member function	value after <code>donations.clear()</code>
<code>donations.size()</code>	0
<code>donations.empty()</code>	true

11. Write code to create a `std::vector` of customers using the default constructor. Each element represents the number of visitors per hour. Specifically, the first element contains the number of visitors in the first hour of operation, the second element for the second hour, and so on. Add the following hours to the vector in the same order: 2, 4, 1, 4, 3, 2, 1, 1. Get the number of times that an hour was logged to the `std::vector` and store it in a variable called `hours_logged`. Get the number of visitors in the fourth hour and store it in a variable called `midday_visitors`.

```
int main() {
    std::vector<int> customers_per_hour;
    customers_per_hour.push_back(2);
    customers_per_hour.push_back(4);
    customers_per_hour.push_back(1);
    customers_per_hour.push_back(4);
    customers_per_hour.push_back(3);
    customers_per_hour.push_back(2);
    customers_per_hour.push_back(1);
    customers_per_hour.push_back(1);
    std::size_t hours_logged = customers_per_hour.size();
    int midday_visitors = customers_per_hour.at(3);

    std::cout << "Logged hours: " << hours_logged << "\n";
    std::cout << "Visitors in the middle of the day: " << midday_visitors << "\n";
    return 0;
}
```

**STOP HERE AND WAIT FOR FURTHER INSTRUCTIONS**

## Model 3. std::vector initialization (6 min)

Start time: \_\_\_\_\_

Line	Code	Visualization												
01	<code>std::vector&lt;int&gt; placeholder(3);</code>	<div>placeholder:std::vector</div> <table><tr><td>0</td><td>0</td><td>0</td></tr><tr><td>0</td><td>1</td><td>2</td></tr></table>	0	0	0	0	1	2						
0	0	0												
0	1	2												
02	<code>std::vector&lt;double&gt; initial {50.0, 5.0};</code>	<div>placeholder:std::vector</div> <table><tr><td>0</td><td>0</td><td>0</td></tr><tr><td>0</td><td>1</td><td>2</td></tr></table> <div>initial: std::vector</div> <table><tr><td>50.0</td><td>5.0</td></tr><tr><td>0</td><td>1</td></tr></table>	0	0	0	0	1	2	50.0	5.0	0	1		
0	0	0												
0	1	2												
50.0	5.0													
0	1													
03	<code>std::vector&lt;double&gt; a_copy(initial);</code>	<div>placeholder:std::vector</div> <table><tr><td>0</td><td>0</td><td>0</td></tr><tr><td>0</td><td>1</td><td>2</td></tr></table> <div>initial: std::vector</div> <table><tr><td>50.0</td><td>5.0</td></tr><tr><td>0</td><td>1</td></tr></table> <div>a_copy: std::vector</div> <table><tr><td></td><td></td></tr></table>	0	0	0	0	1	2	50.0	5.0	0	1		
0	0	0												
0	1	2												
50.0	5.0													
0	1													

		<table><tr><td>50.0</td><td>5.0</td></tr><tr><td>0</td><td>1</td></tr></table>	50.0	5.0	0	1
50.0	5.0					
0	1					

12. Match the constructor's declaration with the most likely code that used it for instantiating the `std::vector`. Write the line number of the corresponding code in the table below.

Constructor declaration	Line # (1, 2, or 3)
<code>vector(size_type count);</code>	01
<code>vector(const std::vector&amp; other);</code>	03
<code>vector(std::initializer_list&lt;T&gt; init);</code>	02

13. Rewrite the code we used to create a `std::vector` with the number of visitors per hour. We will use the constructor taking an *initialization list* parameter (see line 02 for an example) to shorten the code. Specifically, instantiate the `std::vector` with the following values during construction: 2, 4, 1, 4, 3, 2, 1, 1. No need to write code to display information on the screen.

```
int main() {
    std::vector<int> customers_per_hour {2, 4, 1, 4, 3, 2, 1, 1};

    return 0;
}
```

14. *copy constructors* allow us to create new `std::vectors` whose values are copied from an existing `std::vector`. Write code that will copy the contents of an existing `std::vector` (`hours_placeholder`) into a new `std::vector` using a *copy constructor* (see line 03 for an example). You can use any name for your new `std::vector`.

```
int main() {
    std::vector<int> hours_placeholder(8);
    std::vector<int> actual_hours(hours_placeholder);

    return 0;
}
```

## Reflector questions

1. What was the most useful thing your team learned during this session?

2. What previous discussion helped in learning about creating and using `std::vectors`?

3. What is the importance of member function declarations?

4. What did the team do well in this activity?

5. What challenges did the team experience in this activity?

6. If your team experienced challenges, what strategies can you try in the next activity?
